Master's student in Data Science & Analytics at EPITA, **available immediately for a 6-month end-of-studies internship** (Data Analyst, Data Scientist, BI or AI). Project experience across the full data lifecycle: SQL and Python analysis, Power BI dashboards, data-quality pipelines, machine learning and deployed NLP and RAG/LLM applications.

Education

Master's in Computer Science – Data Science & Analytics, EPITA, Paris, France 2024 – 2026
Bachelor's in Information Technology, St. Joseph's College of Engineering, Chennai, India 2020 – 2024

Projects

Repeat Purchase Recovery Analytics GitHub *SQL, SQLite, Python, pandas, Power BI*
- Built a six-layer SQL pipeline (20 SQLite views, 63 validation queries) over 93,358 customers and 96,478 delivered orders to analyse cohort retention, customer lifetime value, segmentation and churn signals.
- Found a 3.0% lifetime repeat rate and a 29-day median return window; single-item first orders (90% of customers) repeat at 2.15% vs 5.38% for baskets of 6+ items.
- Recommended three prioritised retention plays; a scenario model estimates ∼928 additional repeat buyers (+33%) under stated assumptions.

AI Resume & Job Match Analyzer Live demo | GitHub *Python, Streamlit, scikit-learn, PyMuPDF, SQLite, Pytest*
- Built and deployed an NLP web app that parses PDF resumes and scores job fit with an explainable ATS formula (50% skill match, 30% TF-IDF semantic similarity, 20% resume completeness).
- Generates skill-gap analysis, recruiter-style feedback, a cover letter and a LinkedIn message in under 5 seconds; modular codebase with Pytest unit tests and SQLite history.

Fake News Detection Platform (RAG/LLM) *PyTorch, TensorFlow, LangChain, FAISS, FastAPI, PostgreSQL*
- Full-stack fact-checking platform classifying news claims with an ensemble of LSTM, GRU and TextCNN models trained on the LIAR dataset.
- Explainability layer combining web scraping, BERT evidence-relevance scoring, FAISS similarity search and LLM justifications (LangChain, Groq); FastAPI with JWT authentication, PostgreSQL and Docker Compose.

Employee Attrition Prediction System *Python, scikit-learn, Airflow, FastAPI, Docker*
- End-to-end ML system: Airflow ingestion, Great Expectations quality gates separating valid and invalid data, PostgreSQL storage and a Random Forest classifier (F1 0.85 on synthetic data).
- Single and batch predictions served through FastAPI and Streamlit, with Grafana monitoring, Microsoft Teams alerts and Docker Compose deployment.

Retail Business Intelligence & Profitability Optimisation GitHub *SQL, SQLite, Power BI, DAX, Power Query*
- Designed a two-page Power BI report on a star-schema model (1 fact, 4 dimension tables) with six DAX measures, analysing 10,194 sales rows across 5,111 orders (2.33M revenue, 12.56% margin).
- Wrote four SQL analyses of category, product and discount-band profitability, reconciled them with Power BI measures, and highlighted loss-making products for review.

Experience

Android Application Development Intern – National Small Industries Corporation (NSIC) December 2022
- Developed an all-in-one tourism Android app bringing together destination guides, best-season-to-visit recommendations, top places and restaurant suggestions.
- Built a flight search and fare-comparison feature, similar to Google Flights, to help users find cheaper flights; delivered through a structured cycle of development, testing and documentation.

Skills

- **Data Analysis & BI:** SQL, Python (pandas, NumPy), Power BI, DAX, Power Query, Excel (advanced), Matplotlib, Seaborn; KPI, cohort and retention analysis
- **Machine Learning & NLP:** scikit-learn, TensorFlow, PyTorch, Hugging Face Transformers, LSTM, GRU, TextCNN, TF-IDF; RAG with LangChain and FAISS
- **Data Engineering & Deployment:** PostgreSQL, SQLite, Apache Airflow, Great Expectations, FastAPI, Docker Compose, Streamlit, Grafana
- **Tools:** Git, GitHub, Jupyter, Pytest, Android development
